

Electricity

Our specific electricity consumption has decreased from 9.91 kWh per hectolitre in 2004 to 9.46 kWh per hectolitre in 2006. This total is just above the target for 2006 of 9.07 kWh per hectolitre. The actual saving is equal to 54 percent of the targeted reduction.

The economy of scale also had a positive impact. In addition, the new brewhouses in 's Hertogenbosch, the Netherlands, and St. Petersburg, Russia, consumed less energy. Last but not least, breweries carried out energy improvement programmes, such as optimisation of boilers, ventilation systems and the aeration efficiency of waste-water treatment plants, as for example in Warka, Poland.

Indirect CO₂ emissions (emissions caused by our energy suppliers) have increased from 3.30 kg CO₂ per hectolitre in 2004 to 4.21 kg CO₂ per hectolitre in 2006, mainly due to the change of the reporting basis: purchased steam has been included in the indirect emissions reporting.

Specific electricity consumption: breweries and soft drink plants
kWh/hl beer and soft drink

Ozone-layer depleting substances

Emissions of ozone-layer depleting substances to air are registered and expressed as kg of R11 equivalents. More information about the losses of refrigerants and the realised improvements can be found on our website: www.heinekeninternational.com.
